PROFILE

Backend and full-stack developer with hands-on production experience across React, Node.js, Express, and PostgreSQL. I independently designed, built, deployed, and continue to operate UyoFood, a live, revenue-generating food-ordering platform handling real online payments, real-time order tracking, and production infrastructure for real customers and restaurants. Comfortable owning a system end to end — from API design to deployment to fixing it when it breaks at 2am. Currently deepening skills in Docker, CI/CD, and AWS to support distributed, remote engineering teams.

TECHNICAL SKILLS

Frontend: React.js, Vite, JavaScript (ES6+), HTML5, CSS3, Tailwind CSS, Bootstrap, Responsive Design

Backend: Node.js, Express.js, PostgreSQL, REST API design, Socket.io (real-time), Webhook processing

Security: JWT authentication, Helmet, CSP, CORS, rate limiting, input validation, secrets management, webhook signature verification

Payments: Paystack integration, server-side transaction verification, split payments, idempotent event handling

Deployment & Tools: Git/GitHub, Netlify, Neon PostgreSQL, DNS & custom domain configuration, Linux fundamentals

Currently building: Docker, GitHub Actions CI/CD, AWS — hands-on, applied to UyoFood

EXPERIENCE

Independent Developer — UyoFood | *Self-Directed / Freelance*

2026 – Present

- Designed, built, and deployed a full-stack production application (React.js, Node.js, Express.js, PostgreSQL) from scratch — no team, no template, no tutorial.
- Integrated Paystack payments with server-side transaction verification and webhook event processing, including split payments between platform and vendor accounts.
- Built real-time order tracking with Socket.io, giving customers and restaurants live status updates without page refreshes.
- Implemented JWT authentication, Helmet, CSP, rate limiting, and CORS controls to keep the platform safe for real transactions.
- Configured a custom domain, DNS records, and production hosting end to end (Namecheap, LiteHost, Neon PostgreSQL).
- Operate the platform in production: diagnosed and resolved a live network-level outage down to root cause, and handled a customer-facing payment issue quickly and transparently.
- Work directly with a restaurant partner to ship features that move a real, revenue-generating business forward.

FEATURED PROJECT

UyoFood — *React.js, Node.js, Express.js, PostgreSQL, Paystack, Socket.io*

- Live, production food-ordering platform connecting real customers and restaurants — not a portfolio demo.
- Secure payment processing with server-side validation, webhook verification, and split payments between platform and vendor.
- Real-time order tracking and status updates via Socket.io.
- Identified and resolved application security and credential-management issues in a live production environment.
